JEE Mains

MODULE TEST (MT - 01)

Batch : 12<sup>TH</sup> Pass (Desire - A01 & A02)

Date 15.09.2019

### PART - 1 [PHYSICS]

1. Sol. (B)

$$\text{Here } 2t + 6t = \frac{2x}{3} \Rightarrow t = \frac{x}{12}$$

$$\text{average velocity} = \frac{x}{\frac{x}{3 \times 4} + t + t} = \frac{x}{\frac{x}{12} + \frac{2x}{12}} = 4 \text{ m/s}$$

2. Sol. (D)

When mass M reaches at bottom its velocity is downward and it is  $\sqrt{2gH}$ .

Collision lasted for time T.

Since it goes only upto height  $\frac{H}{2}$  after collision its velocity is

upward and is equal to  $\sqrt{gH}$

we know

Rate of change of momentum = Force applied

$$\Rightarrow \text{average net force acting on the mass} = M \frac{M(\vec{v}_f - \vec{v}_i)}{T} = M \frac{M(\sqrt{gH} \hat{j} - (-)\sqrt{2gH} \hat{j})}{T} = \frac{M\sqrt{gH}}{T} (1 + \sqrt{2}) \hat{j}$$

3. Sol. (A)  $mg = Kx_0$  ..... (i)

All force are conservative force & mass m is pulled down slowly.

Here applying principle of conservation of work, we have

$$W_{\text{man}} + W_{\text{mg}} + W_{\text{spring force}} = \text{change in K.E.} = 0$$

$$\Rightarrow W_{\text{man}} = W_{\text{mg}} - W_{\text{spring force}}$$

$$= -mg y + \left\{ \frac{1}{2} K(x_0 + y)^2 - \frac{1}{2} Kx_0^2 \right\} \quad \text{..... (ii)}$$

from (i) & (ii)

$$W_{\text{max}} = \frac{1}{2} \frac{mg}{x_0} y$$

4. **Sol. (D)** Since speed of airplane is constant, so only centripetal force is acting on airplane. there is no tangential force. Obviously when  $\theta = 90^\circ$ , net force on airplane will be towards centre & it will be horizontal.

5. **Sol. (D)** Apply Newton's third law of motion.

6. **Sol. (B)** Figure (a) shows that  $m_A < m_S$  & figure (b) shows that  $m_S < m_B \Rightarrow m_A < m_S < m_B$

7. **Sol. (D)** Centripetal acceleration  $= 50 \cos 37^\circ = \frac{v^2}{R} \Rightarrow 50 \times \frac{4}{5} = \frac{v^2}{10} \Rightarrow v = 20 \text{ m/s}$

8. **Sol. (C)**

Initially system is at rest net momentum = 0 when it is released, m & 3m gains speed.  
spring force is internal force

$$\text{we have } \vec{F}_{\text{ext}} = \frac{d}{dt}(\vec{P}_f - \vec{P}_i)_{\text{system}}$$

$$\therefore \vec{F}_{\text{ext}} = 0 \quad \Rightarrow \quad \vec{P}_{f\text{system}} = \vec{P}_{i\text{system}} = 0$$

So momentum of m & 3 m are opposite but equal in magnitude.

9. **Sol. (D)**

Particle will reach upto D due to conservation of energy.  
(there is no dissipative forces, only conservative forces are there.)

10. **Sol. (A)**

Speed of A just before colliding to B  $= \sqrt{2gh_0}$  and it is horizontal.

When A & B stick together, their combined horizontal

$$\text{speed} = \frac{\sqrt{2gh_0}}{2} = \sqrt{\frac{gh_0}{2}} = \sqrt{\frac{10}{2} \times \frac{24}{100}} = \sqrt{1.2} \text{ m/s}$$

Horizontal speed  $\sqrt{1.2} < \sqrt{2gR} = \sqrt{10}$

So in this case mass will oscillate

maximum height reached = x

Applying conservation of energy,  $\frac{1}{2}(2m)u^2 = (2m)gx$

$$\Rightarrow x = \frac{u^2}{2g} = \frac{1.2}{2 \times 10} = \frac{6}{100} \text{ meter} = 6 \text{ cm}$$

11. **Sol. (B)** F is sinusoidal function of time, so it is periodical

$\mu mg > F$ . So,  $a = 0$

12. **Sol. (D)** Force of engine =  $F = (20 \text{ M})K$   $1M = 1000 \text{ kg}$

$K = \text{constant}$ ,

$$\text{Retardation of last box} = \frac{(4M)K}{4M} = K$$

$$\text{Acceleration of train for 3200 meter} = \frac{20MK}{16M} = \frac{20K}{16}$$

Speed of rest train for this distance = 3200 meter

$$v_1^2 = v^2 + \left(\frac{5}{4}K\right)3200$$

$$\text{Retardation there after} = \frac{(16M)K}{16M} = K$$

$$v^2 = u^2 + 2as$$

$$0 = v^2 + \left(\frac{5K}{4}\right)3200 - 2K(s); S = \frac{v^2}{2K} + \frac{5}{8}(3200)$$

Distance travelled by last box till it stops

$$S_1 = \frac{v^2}{2K}$$

$$\text{Total distance} = 3200 - \frac{v^2}{2K} + 5$$

13. **Sol. (D)**  $N - mg \cos 60^\circ = m(3)$

$$N = 8M$$

$$N = 400 \text{ Newton}$$

$$\text{in kg } 40 \times$$

$$40 = 10x$$

$$x = 4$$

14. **Sol. (A)**

$$W = \int_1^f \vec{F} \cdot d\vec{r} = \int_1^f m\vec{a} \cdot d\vec{r} = m \int_1^f \vec{a} \cdot d\vec{r} = m \times (\text{Area under curve})$$

Here in taking area we take area above axis as + ve & below x - axis as - ve.

$$\text{So } W = 2.25 \{ (\text{Area of curve from 0 to 8m}) + (\text{Area of curve form 8 to 12 m as - ve}) \}$$

$$= 2.25 \left\{ \frac{1}{2} \times 4(8+2) + (-) \times \frac{1}{2} \times 4 \times 2 \right\} = 36 \text{ J.}$$

15. Sol. (C)

F.B.D. of platform

F.B.D. of platform

F.B.D. of mass M

Equation of motion for platform  $f_k + f_s = M \times 0.2g$  F.B.D. of mass M

or  $\mu_k Mg + f_s = 0.2 Mg$

or  $0.1 Mg + f_s = 0.2 Mg \Rightarrow f_s = 0.1 Mg \dots\dots (1)$

Equation of motion for 4 M,  $\frac{F}{2} - f_s = 4M \times 0.2g$

Here 4 M has same acceleration as platform.

$\frac{F}{2} = 0.8Mg + f_s = 0.9 Mg$  (From (i))  $\Rightarrow F = 1.8 Mg$

16. Sol. (A) Let CM of only square without semicircular portion is at distance x right side from origin then

$$\left( M - \frac{M}{4\ell^2} \times \frac{\pi\ell^2}{2} \right) x = \frac{M}{4\ell^2} \times \frac{\pi\ell^2}{2} \left( \ell - \frac{4\ell}{3\pi} \right)$$

$$x = \frac{\frac{\pi}{8} \left( 1 - \frac{4}{3\pi} \right) \ell}{\left( 1 - \frac{\pi}{8} \right)} = \frac{(3\pi - 4)\ell}{3(\pi - 8)}$$

$$\text{Now, } X_{CM} = M \frac{M \left(1 - \frac{\pi}{8}\right) (-) \frac{(3\pi - 4)\ell}{3(\pi - 8)} + \frac{\pi M}{8} \cdot \left(\ell + \frac{4\ell}{3\pi}\right)}{M} = \frac{\ell}{3} = 4 \text{ cm}$$

17. **Sol. (C)**

We can write  $\vec{F} = 40\{(\cos \omega t)\hat{i} + (\sin \omega t)\hat{j}\}$

where  $\omega = 2 \text{ rad/sec.}$

$$\Rightarrow F_x = 40 \cos 2t \quad \& \quad F_y = 40 \sin 2t$$

Here  $F_y$ ,  $N$  &  $mg$  balances each other

$$\text{So } F_x = m \frac{dV}{dt} = 40 \cos 2t$$

$$\text{integrating } mV = 40 \left. \frac{\sin 2t}{2} \right|_0^{t=\frac{\pi}{4\omega}}$$

$$5 \times V = 40 \times \frac{1}{2\sqrt{2}} \Rightarrow V = 2\sqrt{2}$$

$$\therefore \frac{V^2}{8} = 1 \text{ Ans.}$$

18. **Sol. (B)**

$$x_{CM} = \frac{2 \times 0 + 3 \times \ell + 4 \times \frac{\ell}{2}}{4 + 2 + 3}$$

19. **Sol. (C)**

Relative to car, balance forces.

20. **Sol. (C)**

$$mv + 2m(0) = m(0) + 2mv_2$$

$$v_2 = \frac{v}{2}$$

$$e = - \left[ \frac{v_2 - v_1}{u_2 - u_1} \right] = - \left[ \frac{\frac{v}{2} - 0}{0 - v} \right] = \frac{1}{2} = 0.5$$

21. **Sol. (0001)**  $f \rightarrow$  Force of air resistance

$$a_t = \frac{dv}{dt} = 0, \text{ so tangential force} = \text{zero}$$

$$f = \frac{F}{2}$$

only centripetal acn is there

$$F \sin 60^\circ = m (a_{\text{net}}) = \frac{mv^2}{R}$$

$$\frac{F\sqrt{3}}{2} = (10 \times 10^{-3})(10\sqrt{3})$$

$$F = \frac{2}{10}$$

$$\text{Power of } f = fv = \left(\frac{F}{2}\right)v = 1 \text{ watt}$$

22. **Sol. (0002)**  $V = \omega R = 12 \text{ m/s}$

relative horizontal velocity of boll w.r.t wedge = 6m/s

conserve mom in horizontal direction.

If horizontal velocity of wedge w.r.t ground is  $V_1 (\leftarrow)$ ,

the horizontal velocity of mass  $m$  w.r.t. ground is  $(6 - V_1)(\rightarrow)$

$$(2m) V_1 = m (6 - V_1)$$

$$2V_1 = 6 - V_1$$

$$V_1 = 2 \text{ m/s}$$

23. **Sol. (0006)**  $\frac{1}{2} (2m)v^2 = \frac{1}{2} \left[ (k) \frac{d^2}{4} \right]$  (Energy conservation)

Where  $v$  is the velocity of lower block after having elastic collision with particle.

$$V = \left( \frac{2m}{m+2m} \right) V_0 \quad (V_0 \text{ is the minimum velocity of mass } m)$$

$$V = \frac{2V_0}{3} \rightarrow \text{Put in above equation } V_0^2 = \frac{gkd^2}{32m}$$

$$V_0 = 6 \text{ m/s}$$

24. **Sol. (0008)** Net force =  $(F - kx)$

$$KE = \text{work done} = \int_0^x (F - kx) dx$$

$$KE = Fx - \frac{1}{2} kx^2$$

$$K \text{ max when } \frac{d(KE)}{dx} = 0 \text{ or } x = \frac{F}{k} \text{ and max KE} = Fx - \frac{1}{2} kx^2 = \frac{F^2}{k} - \frac{1}{2} k \left( \frac{F^2}{k^2} \right) = \frac{F^2}{2k} = 4$$

$$F^2 = 8k \text{ and } F = kx \text{ or } x = \frac{F}{k} = 1 \text{ meter}$$

$$F = k$$

we have  $F = 8 \text{ Newton}$

25. **Sol. (0002)** No external force

$$\text{So } V_{\text{com}} = \text{const} = \frac{m_1 V_1 + m_2 V_2}{m_1 + m_2} = \frac{(3 \times 2) + (2 \times 2)}{5} = 2 \text{ kg m/s}$$
